

MONKEY BOARD FALL ARRESTOR

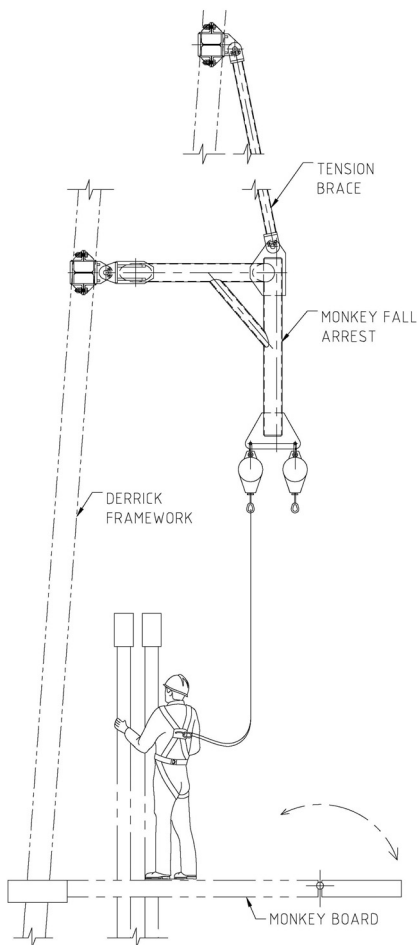

Custom made to suit each rig
Improving Safety and Performance

ICON can design and install custom made monkey board fall arrestors to suit your rig and your drilling programme.

Background

A fall arrest device is essentially a unit with retractable lifeline which can be used to allow a worker freedom of movement when working at heights. In the event of a fall, the unit will lock and arrest the faller. During this process 'brakes' within the unit will operate ensuring that the forces on the faller are limited.

To ensure the faller does not swing unnecessarily, it is necessary to provide support for the fall arrestor directly above the worker. Failure to do so, could cause unnecessary injury to the worker.

General Arrangement

Transocean Legend gets New Fall Arrestor

ICON designed and installed a custom made monkey board fall arrestor for the Transocean Legend MODU.

The fall arrestor frame is two-pieced with a support davit and a backstay. Each piece has clamped connections that are bolted to the derrick steelwork. ICON's unique design ensures the bolts do not loosen during use and previously obtained site dimensions guarantee the frame is a snug fit.

Using rope access, ICON installed the fall arrestor while the rig was on tow saving critical rig time. At ICON, safety is paramount and this work was no exception with the installation occurring LTI and incident free.

Installed Fall Arrestor on the Transocean Legend

ICON understands the challenges Clients face in providing a safe work location. Please feel free to discuss any queries you may have regarding the monkey board fall arrestor with any our staff.
